

Archive One Access Security Manager

LOCK DOWN YOUR EMAIL ACCESS

Access Security Manager provides administrators with control and verification of Exchange Mailbox and public folder access rights and permissions.

An organization may be open to many levels of email abuse, not only issues of archive security, if there is no method of knowing who has the ability to look into mailboxes and act as if they were that mailbox owner.

Benefits

- Audits Exchange security settings quickly & effectively
- Validates the integrity of access to email stores and public folders
- Pre-empts security breaches
- Provides additional security for any email archive system
- Ensures the safeguards for confidential information
- Finds anonymous and deleted users
- Prevents email impersonation
- Reduces email leaks
- Is easy to implement, maintain and manage

Access Security Manager allows you to manage security for mailboxes folders and public folders in Exchange: providing integrity for your mail systems before compromised data is committed optionally to archive. It allows you to detect 'shadow users'; those users who might gain access (accidentally or otherwise) to the mailboxes of others. The Access Security Manager then enables you to update users' permissions in line with approved security policy and practices.

Audit Exchange security

Access Security Manager automates the multiple tasks involved in compiling security settings, performs mass updates and presents simple summaries for the administrator. To detect and rectify unintentional or malicious breaches in mailbox folder or public folder access rights.

Pre-empt security breaches

Access Security Manager can run automatically, at set times, to provide on-going audits of access rights across the whole organization. This enables errors to be detected before they are exploited.

Provide additional security for any email archive system

Access Security Manager has been designed to enhance the integrity of data within any email compliance archive, not only Archive One.

Validate integrity of email

Access Security Manager makes sure that the correct users have rights of each and every mailbox.

Ensure the safeguards for confidential information

Access Security Manager helps prevent unauthorized users from gaining access to confidential or critical information by making certain that appropriate permissions are set.

Anonymous and deleted users

Reduce the possibility of zombie* users coming into existence as organizations evolve.

Prevent email impersonation

Access Security Manager prevents misrepresentation through misuse of organizational email IDs. It finds and helps remove erroneous 'Send on Behalf of' permissions, preventing email impersonation.

Reduce email leaks

Access Security Manager removes the temptation to communicate sensitive data; whether uncovered in error or by the efforts disgruntled staff.

Easy to implement, maintain and manage

Quick wizard-guided install, simple admin controls and standard interfaces minimize the Total Cost of Ownership.

FEATURES

Mailbox and public folders

Access Security Manager enables easy management of permissions which control access to core parts of the mail system and prevent unauthorized access to sensitive information.

Standard rights searches

By using a Security Wizard Manager for rights control administrators can monitor the integrity of mailbox and public folder permissions without needing to detail how the mail store security structure is configured.

User Permissions

Provides full information of all those with permissions over user mailboxes and Exchange stores.

'Send on Behalf of'

Access Security Manager specifically identifies 'Send on Behalf of' permissions. Administrators are able to identify rogue users who may try to impersonate other staff – and stop them.

Zombie users

Zombie users can occur when a user is deleted from the email system, and their legacy permissions remain in the system. Later when a new user joins with the same user ID he or she inherits these dormant permissions in full. Access Security Manager alerts the administrator to Zombies.

Secure email archive

No matter which email archive solution is in place mailboxes access rights are verified to help make sure that false information is not placed into archive. The access rights to the archive itself can also be verified.

Flexible permissions

Collate permissions for parts of the information store and focus on specific users, distribution lists and mailbox folders over different servers with specific mailbox exclude controls.

Post to external database

Posts information about permission settings and updates to an external database from where the information can be analyzed and reused.

Mass updates of permissions

Access Security Manager supports update permissions across the full selection of users and folders, whichever the administrator has selected, as a single action.

Optional read only control

Provides hierarchical administration with operators able to be set-up to only run permissions checks and read results, but do no changes.

Automatic permission searches and updates

Access Security Manager can run regularly for preventative monitoring and control over access permissions to avoid security flaws from developing or being exploited.

Multiple Mailbox folder types

Access Security Manager can distinguish between all folder types including: Mail folders, Calendar folders, Notes folders, Journal folders and Contacts. It makes sure that legitimate diary sharing is not effected by changes in permissions which access email stores.

MMC Interface

Access Security Manager is driven via a standard Microsoft MMC interface so that administrators can start using it without specialist training. This reduces configuration times and results in low on-going running costs.

Hidden mailboxes options

Hidden mailboxes may be included or excluded from the access information. This can simplify the analysis of information for the administrator.

Scalable structure

Access Security Manager helps to secure tens to hundreds of thousands of users on multiple mail servers. The combination of detailed analysis of mail system security and clear administrative controls makes the Access Security Manager effective and reliable for both small and large organizations.

Software specifications and requirements

Windows 2000 or later with the latest service packs.
Outlook 2000 or later configured to connect to an Exchange server.

Access Security Manager will process permissions from Exchange 2000 or later, on the latest service packs.
